

The Pipeline of Data Visualization illustrated with Swiss parliament data

Joachim Muth, Gael Lederrey & Jonas Racine

École Polytechnique Fédérale de Lausanne

Introduction

This project represents the final point of **Applied Data Analysis** cours, taught by Michele Catasta in 2016. We put into practice the analysis of real-world data, following the whole pipeline, from **scrapping** to **interactive visualization**. We experiment what are the **real-world challenges** encountered in such a project. Our case study focuses on the data available on www.parliament.ch which describes all publicly available activities of Swiss parliamentary deputies.

Motivation

Since the **The Freedom of Information Act** entered into force (on 1 July 2006) a huge amount of data related to political activities are freely available to the public. However, it represents a big amount of documents hardly understandable. We suggest an interface giving **light overview** of Swiss parliamentaries.

1. Data Acquisition

Parliament IT service provides an API, which allows direct access to database tables. However, it presents some restrictions:

- **Limited** returned items per request
- Too short **timeout**, forbidden the use of **skip** to access last elements of big tables.

We developed a python scraper that bypasses these restrictions.

2. Data Preparation & Cleaning

The database tables collected contains numerous problems:

- Hashed primary key (ID)
- Multiple entries for same item in different languages
- 3 different ID's to designate a parliamentary

3. Constraints choices

As working on data involving public peoples, we forbid ourselves for any **subjective interpretations**. Instead, we focus on a visualization tool from which other people (e.g. journalist) can draw conclusions. Hence, it needed to be transparent enough to be trusted.

Conclusion

This project gives an **overview of some challenges** that could be encountered at each step of the process, when trying to analyse real-world data. It puts in evidence the interdisciplinarity of data analysis, requiring the full range of skills: **coding** to master the numerous IT tools; **analytical** to take on what to focus on; **curiosity** to understand the field where data come from; **social** to interact with domain experts and understand their point of view.

4. Data Interpretation

Under reasonable assumptions:

- **Involvement**: number of speeches and initiatives
- **Interests**: distribution of wrote and signed initiatives between themes.
- **Partnerships**: cosigned initiatives.

Involved IT tools

- Scrapping and data analysis with **Python**, enhanced with Pandas, NumPy and SciPy libraries.
- Visualization with **JavaScript**, enhanced with D3JS and JQuery
- Website with **Bootstrap**.

5. Visualization

We want the visualization to be:

- **Intuitive** enough to be used without explanation.
- **Enjoyable**, so people have fun playing with it.
- **One page sized**, to lower complexity
- View per **deputy** or per **agglomerated group**.

6. Assessment from Domain Expert

Meeting with **Alain Rebetez**, political journalist, and **Philippe Nantermod**, PLR deputy.

- Expertise about Political system.
- Is the visualization intuitive enough?
- What informations would they like to see?

7. ... and next ?

Go back to point 3 and iterate until reaching the deadline :)

Acknowledgements

A warm thank you to **Alain Rebetez**, political journalist, and **Philippe Nantermod**, PLR deputy at National Council, for their expertise in Swiss parliamentary system and their external point of view about the project.
